

DIYAA - AI Speaking Evaluation System Update

This update improves DIYAA speaking evaluation for sentence speaking and story speaking levels. The system should NOT use strict regex matching because children may speak incomplete, broken, grammatically incorrect, or differently structured sentences.

Updated AI Speaking Logic

- Use AI semantic understanding instead of exact sentence matching.
- Do NOT fail students for punctuation mistakes.
- Do NOT fail students for minor grammar mistakes.
- Do NOT require exact sentence order.
- Accept meaningful spoken intent.
- Evaluate whether the student understood the topic.
- If answer meaning is correct → mark partially correct or correct.
- If grammar is weak → provide improved sentence feedback.

Example AI Evaluation Cases

Student Speech	System Result	AI Feedback
Picnic do good	Acceptable	Correct sentence: The picnic was good.
I goed school	Acceptable with correction	Correct sentence: I went to school.
Apple red color	Acceptable	Correct sentence: The apple is red.
Horse running fastly	Acceptable with correction	Correct sentence: The horse is running fast.
My school very big	Acceptable	Correct sentence: My school is very big.

Recommended Evaluation Flow

- Student speaks using microphone.
- Speech-to-text converts voice into text.
- AI evaluates semantic meaning.
- AI checks whether topic understanding exists.
- Grammar correction AI improves sentence.
- Corrected sentence displayed on screen.
- Narrator reads corrected sentence aloud.
- correct.mp3, stars, and rewards still play for meaningful answers.

Important Implementation Note

DIYAA speaking evaluation should behave like a smart AI tutor, not a strict exam checker. The goal is confidence building, communication practice, pronunciation improvement, and gradual grammar enhancement for students.
